

CS 351 Meet 1 (Tuesday October 14, @ UIC Library)

General Meeting Notes-

Created sub branches for each person

Goal is to have the login, main menu, and tags functional for the first meet

Figma-

First screen: welcome screen with login option, that allows you to log in with your UIC account or enter as guests. Guests cant post or bookmark though

Second screen: Main menu, with recency list of topics that were last searched by the user. Clicking on a topic leads to the posts related to it.

Third Screen: Playlist screen, with list of bookmarked posts, along with the option to create custom lists and attached posts

Colors - white, red, navy blue accents

Frontend-

- Wiki homescreen that allows you to navigate through posts
- Will include buttons that will allow the user to create an account, log-in through UIC and a guest version for people who don't want to create an account
- Based on the user preference, the next screen will give the user a sorted screen of most relevant topics based on preference
- Next screen will include a custom page where users can have their bookmarked posts, and custom things they saved stored on this screen

Backend-

- Recency List for topics most searched by user
- Store data in SQLite3 database for now, with username, email, list of posts, and list of most searched topics
- Implement login through Auth0
- Create a class for posts, containing postID,title,text,etc
